

White Rabbit X — Guida di ottimizzazione WFO

Riferimento autorevole generato dalla fonte EA e dal manifesto correnti — EA 1.11 — 127 inputs — 3738 sets

Attenzione alla data. Con il WFO attivo, OnTester confronta la fine reale del test con `input_end_date` e restituisce zero se il test è terminato prima (tolleranza di 80 ore). Una data sbagliata azzerà tutte le passate e l'intera ottimizzazione sembra rotta. Imposta `input_end_date` sulla stessa data finale configurata nello Strategy Tester.

Ambito e fonti di verità

La fonte definisce inputs, valori e funzioni; il manifesto definisce ogni set, stato, percorso e SHA-256. L'archivio Quantum è solo storico.

EA SHA-256: D85A30A0836A9BE75F6DFC55868BDC664EE1FC7F5DD0840C029DEB0EF8AC8973.

Manifest SHA-256: E96B9E4050F8EA8B764E187BD6CC1E907AE2AE8C4A6489C9EF2D3317C6003F75.

Materiale generato; gli identificatori corrispondono esattamente all'EA.

Metodo walk-forward

Usare IS, OOS e forward demo cronologici con spread, commissione, swap e slippage realistici.

Flusso sicuro

Modificare una sola matrice per fase e conservare le prove.

- Allineare EX5, fonte, schema set e manifesto.
- Caricare la libreria tramite Strategy Tester Inputs.
- Mappare simbolo e suffix esatti.
- Iniziare dai baseline 01–05 con BUY/SELL separati.
- 06 è ricerca a un solo asse.
- 07 ingresso, 08 filtri, 09 rischio, 10 uscita.
- Eseguire IS, OOS e forward demo cronologici.
- Controllare Status, RelativePath e SHA256.
- Solo USE esplicito autorizza l'ambiente definito.

Stati e decisione

Lo stato esatto resta e viene mappato prudentemente in USE, REOPTIMIZE, RESEARCH o HOLD.

Sistema	Gestione	Set
01_SLTP	Stop Loss + Take Profit as ATR multiples	356
02_SLTP_ORGANIC	SL + organic take anchored on the last trade	356
03_TRAIL_ONLY	SL + trailing, no TP: let it run	356
04_SLTP_TRAIL	SL + TP + trailing behind	356
05_BE_TRAIL	Mandatory breakeven + trailing	356
06_REVERSAL_EXIT	Closes on the indicator's opposite signal	356
07_GRID_SEPARATE	Grid with a target per side (hedging account)	356
08_GRID_UNIFIED	Grid with a single basket target (hedging account)	356
09_MARTINGALE	Lot doubles after a loss, one position per side	356
10_DALEMBERT	Lot grows in arithmetic steps after a loss	356
11_SIGNAL_ONLY	No SL and no TP: measures the raw signal	356

Questa sezione è per ora disponibile solo in inglese.

Modeling mode: use real ticks

In the Strategy Tester's **Settings** tab, **Modeling** field:

` Every tick based on real ticks <- use this OHLC 1 minute <- only 01\_SLTP and 02\_SLTP\_ORGANIC `

This is not a preference. Measuring the same set in both modes across three years, the OHLC mode **understated losses by 3.3x on trailing systems and 23x on grid** — always in the optimistic direction. Only fixed SL/TP stayed within 3%.

The cause is structural: trailing and grid depend on **when** price touched each level inside the bar. OHLC mode interpolates that from four prices per minute and smooths away exactly the adverse excursions that would have closed the position. Optimizing a trailing system on interpolated bars selects parameters that survived a price path which never happened.

Real ticks cost roughly 20x more time per pass. It is worth it: that is the difference between a result and a number.

If you must save time, save it in the right place

Signals are evaluated at BAR CLOSE, so choosing indicator, method or timeframe gives the same entry instant in both modes. Stop, target and trailing, on the other hand, depend on the intrabar path.

So use each model where it is reliable: OHLC to narrow the switches (indicator, method, timeframe, periods) and real ticks for the exit geometry. With the signal locked the search space collapses by orders of magnitude, and real ticks stop being prohibitive.

Fixed-R to research, percentage to trade

Optimize in **Fixed-R**: with the base capital frozen, passes stay comparable to each other and across symbols. +40R on gold and +40R on EURUSD mean the same thing, while "+3,200 USD" means nothing without knowing

the lot and the balance.

Live, **Percentage** usually makes more sense: it tracks the account, compounds as it grows and cuts exposure as it shrinks — protection Fixed-R cannot give, because it deliberately ignores the running balance. Both modes report in R, so the record stays readable after the switch.

Avviso di rischio

Nessun EA, set o storico garantisce il futuro. Validare OOS e demo.
